

What is ML?

- is branch of AI that focuses on developing models and algorithms that let the computers learn from data and make decisions/predictions without being explicitly programmed

Algorithms :

- Linear Regression
- Logistic Regression
- Decision trees
- Random Forest

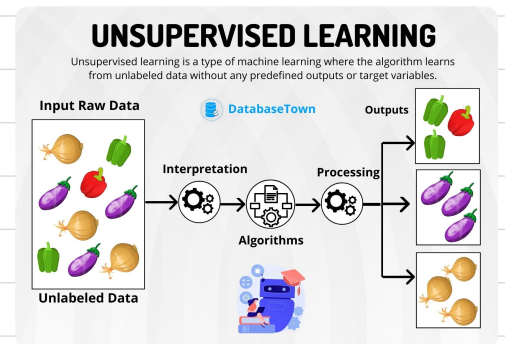

ML

SUPERVISED

- type of machine learning where a model is trained on labeled data

UNSUPERVISED

- finds patterns or group in unlabeled data **clustering**

types of Prediction

Regression

continuous

- House Price

Predict a num that close to true value using different features

Classification

discrete

Binary Classification

- cat / dog

- Positive / negative

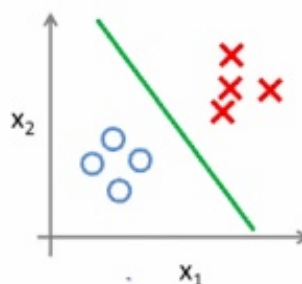

- spam / not spam

Multi-class Classification

- cat / dog / dolphin

- orange / white / red

Binary classification:

Multi-class classification:
